A small classifier tells CAKE which flow is the call

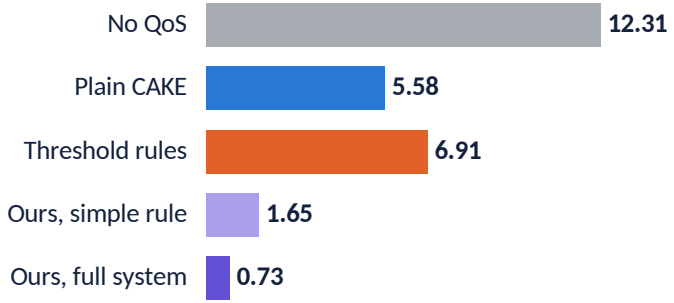

Interim: 6 of 10 seeds, emulated

So calls and games stay usable when they share a device with downloads, where fair queueing and threshold rules both fail

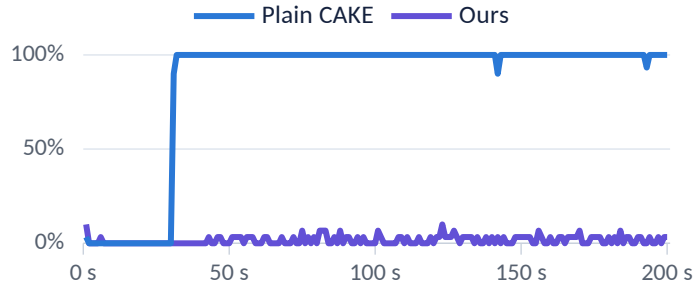

87%

less damage than plain CAKE
flows left unusable over 9 home scenarios, 5.58 down to 0.73

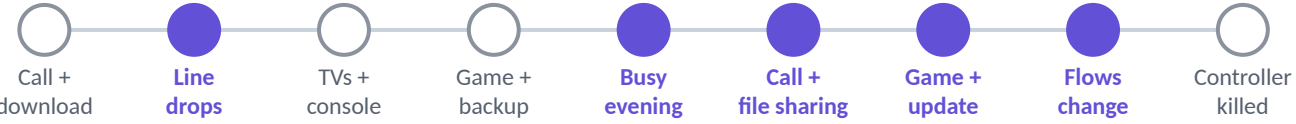

94% → 2%

late frames on the HD call
while its laptop shares files. Median of 6 seeds; the chart is one run, sharing starts at 30 s

Wins where a call or game shares its device with bulk traffic or the line speed changes. **Ties** where plain CAKE already copes

53 of 54
runs equal or better than plain CAKE. **0 worse than threshold rules**

Line drop 100 to 20 Mbit/s caught in 353 ms · Watchdog back to plain CAKE in 2.02 s (limit 3 s) · QoE check rolls back bad changes · 214 unit tests

Interim: 6 of 10 seeds. 270 of 270 runs valid in an emulated home testbed on Linux CAKE; rootless, one command to reproduce; not yet on router hardware

How it works, in full
