START: the router boots
CAKE shapes the line to 95% of its rate
AQoSE installs marking, the watchdog arms
You join a video call on your laptop
The same laptop starts a cloud backup
First 8 packets of the call
sizes and gaps only
First 8 packets of each backup connection
What is it?
What is it?
video call, 62% sure
background transfer, over 80% sure, TCP
not sure enough
Video tin
Bulk tin
Best Effort tin
outside for 2 to 6 s in a row,
or the routine recheck every 30 to 60 s
CAKE sends the call's packets first
up to half the line
The backup takes what is left
inside
END: the call stays smooth
under 1% late frames instead of 94%
Each second, a cheap check, no model:
still inside its class's normal range?
